

WARNING

**The fire codes on Radiant Barrier
Have been rewritten and are now
Mandated ASTM-84 and ASTM E2599**

The American Society for Testing and Materials has ruled that, since Radiant barriers are self-supported when they are installed, they should not be Supported by any other materials when tested for flame and smoke. As a result Of this ruling, all radiant barrier products made from traditional aluminum foil FAILED the new E2599 fire test.

These ASTM fire tests are adopted by international codes like IRC, IBC, IECC and others, which are then mandated by every major code body in The United States. It doesn't matter if you are doing residential, commercial or Industrial buildings, because they all require ASTM testing and certifications.

After two years of research and development, Green Energy Barrier Developed the first and only radiant barrier to pass the stringent new ASTM E84 And ASTM E 2599 fire tests. By replacing the aluminum foil with our revolutionary Highly reflective aluminized film, we were able to achieve, not only a passing Grade, but a perfect flame spread of ZERO.

If you buy, sell or install a radiant barrier product that does not meet New ASTM E 84 and ASTM E 2599 fire codes, you are at an ENORMOUS LIABILITY OR DANGER. You can buy directly from a authorized Green Energy Barrier Dealer. Beware of all Radiant Barriers and ask to see if they have passed The new 2010 ASTM E 84 and ASTM E 2599
